What is claimed is:

1. A method for communication via a data network, between two parties that share a password, using a Diffie-Hellman type key exchange on a particular group to generate a shared secret g^{xy} , where g is the group generator known to both parties and x is an index known to one party and y is an index known to the other party, the group having a group operation and an inverse group operation, the method comprising the steps of:

one party generating a parameter m by performing the group operation on g^x and a function of at least the password, wherein any portion of a result associated with the function that is outside the group is randomized, and transmitting m to the other party, whereby the other party may perform the inverse group operation on m and the function of at least the password, and remove the randomization of any portion of the result associated with the function that is outside the group, to extract g^x and calculate the shared secret g^{xy} .

- 2. The method of claim 1, wherein the particular group, denoted as $G_{p,q}$, is a sub-group of a group Z_p^* where p and q are prime numbers such that p equals rq + 1 for a value r co-prime to q, and wherein the step of randomizing any portion of a result associated with the function that is outside the group $G_{p,q}$ is performed by computing a parameter h, randomly selected from the group Z_p^* , raising the parameter h to the exponent q and multiplying h^q by the result associated with the function.

- 3. The method of claim 1, wherein the one party is a client and the other party is a server.
- 1 4. The method of claim 1, further comprising the step of:
- 2 the one party receiving g^{y} from the other party and generating the shared secret g^{xy} .
 - 5. The method of claim 4, further comprising the step of:

the one party authenticating the other party by comparing a received value against a function
of at least one of an identifier of the one party, an identifier of the other party, m , g^{ν} , the shared
secret, and the password.

- 6. The method of claim 4, further comprising the step of:
- the one party transmitting a function of at least one of an identifier of the one party, an identifier of the other party, m, g^{ν} , the shared secret, and the password, to the other party whereby the other party may authenticate the one party.
 - 7. The method of claim 4 further comprising the step of:

the one party generating a session key as a function of at least one of an identifier of the one party, an identifier of the other party, m, g^{ν} , the shared secret, and the password.

8. A method for communication via a data network, between two parties that share a password, using a Diffie-Hellman type key exchange on a particular group to generate a shared secret g^{xy} , where g is the group generator known to both parties and x is an index known to one party and y is an index known to the other party, the group having a group operation and an inverse group operation, the method comprising the steps of:

responsive to the one party generating a parameter m by performing the group operation on g^x and a function of at least the password, wherein any portion of a result associated with the function that is outside the group is randomized, and transmitting m to the other party, the other party performing the inverse group operation on m and the function of at least the password, removing the randomization of any portion of the result associated with the function that is outside the group, extracting g^x , and calculating the shared secret g^{xy} .

9. The method of claim 8, wherein the particular group, denoted as $G_{p,q}$, is a sub-group of a group Z_p^* where p and q are prime numbers such that p equals rq + 1 for a value r co-prime to q,

- and wherein the step of randomizing any portion of a result associated with the function that is 3 outside the group $G_{p,q}$ is performed by computing a parameter h, randomly selected from the 4
- group Z_p^* , raising the parameter h to the exponent q and multiplying h^q by the result associated with 5
- the function. 6

10. In accordance with a protocol for communication over a data network between two parties that share a password, using a Diffie-Hellman type key exchange on a particular group to generate a shared secret g^{xy} , where g is the group generator known to both parties and x is an index known to one party and y is an index known to the other party, the group having a group operation and an inverse group operation, apparatus associated with the one party comprising:

at least one processor operative to: (i) generate a parameter m by performing the group operation on g^x and a function of at least the password, wherein any portion of a result associated with the function that is outside the group is randomized; and (ii) transmit m to the other party, whereby the other party may perform the inverse group operation on m and the function of at least the password, and remove the randomization of any portion of the result associated with the function that is outside the group, to extract g^x and calculate the shared secret g^{xy} .

- 11. The apparatus of claim 10, wherein the particular group, denoted as $G_{p,q}$, is a sub-group of a group Z_p^* where p and q are prime numbers such that p equals rq+1 for a value r co-prime to 3 q, and wherein the step of randomizing any portion of a result associated with the function that is outside the group $G_{p,q}$ is performed by computing a parameter h, randomly selected from the 4 group Z_p^* , raising the parameter h to the exponent q and multiplying h^q by the result associated with 5 6 the function.
- 1 12. The apparatus of claim 10, wherein the one party is a client and the other party is a 2 server.

- 1 13. The apparatus of claim 10, wherein the at least one processor associated with the one 2 party is further operative to receive g^{ν} from the other party and generate the shared secret g^{ν} .
 - 14. The apparatus of claim 13, wherein the at least one processor associated with the one party is further operative to authenticate the other party by comparing a received value against a function of at least one of an identifier of the one party, an identifier of the other party, m, g^y , the shared secret, and the password.
 - 15. The apparatus of claim 13, wherein the at least one processor associated with the one party is further operative to transmit a function of at least one of an identifier of the one party, an identifier of the other party, m, g^{ν} , the shared secret, and the password, to the other party whereby the other party may authenticate the one party.
 - 16. The apparatus of claim 13, wherein the at least one processor associated with the one party is further operative to generate a session key as a function of at least one of an identifier of the one party, an identifier of the other party, m, g^{ν} , the shared secret, and the password.
 - 17. In accordance with a protocol for communication over a data network between two parties that share a password, using a Diffie-Hellman type key exchange on a particular group to generate a shared secret g^{xy} , where g is the group generator known to both parties and x is an index known to one party and y is an index known to the other party, the group having a group operation and an inverse group operation, apparatus associated with the other party comprising:

at least one processor operative to, in response to the one party generating a parameter m by performing the group operation on g^x and a function of at least the password, wherein any portion of a result associated with the function that is outside the group is randomized, and transmitting m to the other party: (i) perform the inverse group operation on m and the function of at least the

password; (ii) remove the randomization of any portion of the result associated with the function that is outside the group; (iii) extract g^x ; and (iv) calculate the shared secret g^{xy} .

- 18. The apparatus of claim 17, wherein the particular group, denoted as $G_{p,q}$, is a sub-group of a group Z_p^* where p and q are prime numbers such that p equals rq + 1 for a value r co-prime to q, and wherein the step of randomizing any portion of a result associated with the function that is outside the group $G_{p,q}$ is performed by computing a parameter h, randomly selected from the group Z_p^* , raising the parameter h to the exponent q and multiplying h^q by the result associated with the function.
 - 19. An article of manufacture for communication via a data network, between two parties that share a password, using a Diffie-Hellman type key exchange on a particular group to generate a shared secret g^{xy} , where g is the group generator known to both parties and x is an index known to one party and y is an index known to the other party, the group having a group operation and an inverse group operation, the article comprising a machine readable medium containing one or more programs which when executed implement the steps of:

one party generating a parameter m by performing the group operation on g^x and a function of at least the password, wherein any portion of a result associated with the function that is outside the group is randomized, and transmitting m to the other party, whereby the other party may perform the inverse group operation on m and the function of at least the password, and remove the randomization of any portion of the result associated with the function that is outside the group, to extract g^x and calculate the shared secret g^{xy} .

20. An article of manufacture for communication via a data network, between two parties that share a password, using a Diffie-Hellman type key exchange on a particular group to generate a shared secret g^{xy} , where g is the group generator known to both parties and x is an index known to one party and y is an index known to the other party, the group having a group operation and an

- 5 inverse group operation, the article comprising a machine readable medium containing one or more 6 programs which when executed implement the steps of:
- responsive to the one party generating a parameter m by performing the group operation on g^x and a function of at least the password, wherein any portion of a result associated with the function that is outside the group is randomized, and transmitting m to the other party, the other party performing the inverse group operation on m and the function of at least the password, removing the randomization of any portion of the result associated with the function that is outside the group, extracting g^x , and calculating the shared secret g^{xy} .
